Using the archived observational data at 1369 MHz with the Parkes 64-m radio telescope, Rukiye Rejep, a Ph.D. student from the Pulsar Group at the Xinjiang Astronomical Observatory (XAO) of the Chinese Academy of Sciences and her collaborators have investigated the nulling and sub-pulse drifting properties of PSR J1727-2739.

Their findings were published in *Monthly Notices of the Royal Astronomical Society* on Nov. 23, 2021.

Pulse nulling is a kind of emission change where pulsed emission suddenly turns off for several pulse periods and then just as suddenly turns on.

Although most of these emission changes are largely considered to be random processes, some changes are reported to show periodicities. Sub-pulse drifting is the best-known periodic [emission](#) variation in which sub-pulses [drift](#) in pulse phase or longitude across a sequence of single pulses.

Pulsars exhibiting nulling along with drift mode changing, such as PSR J1727-2739, provide a unique opportunity to investigate the physical mechanism of these phenomena.

In this study, the researchers derived a nulling fraction of 66 percent  $\pm$  1.4 percent for this [pulsar](#), and found that the burst and null lengths distributions of PSR J1727-2739 clustered between two and five [pulse](#) periods.

In addition, they observed two distinct drift modes for this pulsar, and revealed that besides the previously known drifting sub-pulses in the leading component, this pulsar also shows drifting sub-pulses in the trailing component.

The two profile components shared the same drift periodicity  $P_3$  in a given drift mode, but the horizontal drift periodicity  $P_2$  were quite different. The drift rate of the trailing component was somewhat higher than that of the leading [component](#) in both drift modes.

More comprehensive studies based on more sensitive, longer and multi-frequency observations for this kind pulsars would certainly provide intriguing details to understand the true nature and origin of these phenomena, according to the study.
