

Here are the most effective things you can do to fight climate change

July 1 2022, by Max Callaghan

The first three charts show, in descending order, how effective different behaviours are at cutting emissions. Credit: Max Callaghan, Author provided

Limiting global warming to 1.5°C above pre-industrial levels requires reaching net zero emissions by the middle of this century. This means that, in less than three decades, we need to reverse more than a century of rising emissions *and* bring annual emissions down to near zero, while balancing out all remaining [unavoidable emissions](#) by actively removing carbon from the atmosphere.

To help speed this process as individuals, we've got to do everything we can to cut down our use of fossil fuels. But many people [aren't aware](#) of the most effective ways to do this. Thankfully, the latest report by the UN climate change panel [IPCC](#) devotes a chapter to all the ways in which changes in people's behavior can accelerate the transition to net zero.

The chapter includes an analysis of 60 individual actions which can help fight climate change, building on [research](#) led by Diana Ivanova at the University of Leeds—and to which I contributed. We grouped these actions into three areas: avoiding consumption, shifting consumption and improving consumption (making it more efficient). The charts below, produced for the [IPCC report](#), show what we found.

What to avoid

By far the most effective things to avoid involve transport. Living without a car reduces [greenhouse gas emissions](#) by an average of 2 tons of CO₂ emissions per person per year, while avoiding a single long distance return flight cuts emissions by an average of 1.9 tons. That's

equivalent to driving a [typical EU car](#) more than 16,000km from Hamburg, Germany to Ulaanbaatar, Mongolia and back.

Since the vast majority of the world's population do not fly at all—and of those who do, only a [small percentage](#) fly frequently—fliers can make very substantial reductions to their carbon footprints with each flight they avoid.

What to shift

But living sustainably is not just about giving things up. Large reductions in emissions can be achieved by shifting to a different way of doing things. Because driving is so polluting, for example, shifting to [public transport](#), walking or cycling can make an enormous change, with added benefits for your personal health and local air pollution levels.

Likewise, because of the high emissions associated with meat and dairy—particularly those produced by farming sheep and cows—shifting towards more sustainable diets can substantially reduce your carbon footprint. A [totally vegan diet](#) is the most effective way to do this, but sizeable savings can be made simply by switching from beef and lamb to pork and chicken.

What to improve

Finally, the things we do already could be made more efficient by improving carbon efficiency at home: for example by using insulation and [heat pumps](#), or producing your own renewable energy by installing solar panels. Switching from a combustion car to an electric one—ideally a battery EV, which generates [much larger reductions](#) in emissions than hybrid or fuel cell EVs—will make your car journeys more efficient. Plus, its effect on emissions will increase as time goes by

and the amount of electricity generated by renewables grows.

In the race to net zero, every ton of CO₂ really does count. If more of us take even a few of these suggestions into account, we're collectively more likely to be able to achieve the ambitious goals set out in the Paris climate agreement. Of course, these changes will need to be backed by major political action on sustainability at the same time.

If we're to use less fossil fuel energy, the use of fossil fuels needs to be either restricted or made more expensive. The social consequences of this need to be carefully managed so that [carbon pricing schemes](#) can benefit people on lower incomes: which can happen if [revenues are redistributed](#) to take the financial burden off poorer households.

But there's a whole lot more that governments could do to help people to live more sustainably, such as providing better, safer public transport and "active travel" infrastructure (such as [bike lanes](#) and pedestrian zones) so that people have alternatives to driving and flying.

There's no avoiding the fact that if political solutions are to address [climate change](#) with the urgency our global situation requires, these solutions will limit the extent to which we can indulge in carbon-intensive behaviors. More than anything, we must vote into power those prepared to make such tough decisions for the sake of our planet's future.
