A report launched today by UNSW Sydney and Australian Council of Social Services (ACOSS) Poverty and Inequality Partnership confirms that even though Australians are now, on average, the fourth richest people in the world, the distribution of our wealth remains hugely unequal.

"[The Wealth Inequality Pandemic: COVID and Wealth Inequality](#)" says our overall household [wealth](#) has grown as much in the last three years as it did in the previous 15—despite the COVID-19 pandemic and the recession in 2020—thanks primarily to the soaring cost of residential properties across the country during that period.

## **The impact of rapidly rising house prices**

Over two-thirds (69%) of the overall increase in household wealth during the pandemic was in residential property, which rose in value by 22% through the year to December 2021—the highest annual increase in 35 years.

Rising house prices increase the divide between people who bought their homes when they were more affordable and [younger people](#) and those on low and modest incomes who are shut out of [home ownership](#) or struggle with escalating rents and mortgage payments.

"Once again, this report reminds us that wealth in Australia is distributed very unevenly. We have over 130 billionaires in this country and last year their wealth grew, on average, by \$395 million or 12%. It means they now hold almost as much wealth as the 2.8 million households in the lowest 30% of the population," says Scientia Professor Carla Treloar, Director of the UNSW Social Policy Research Center (SPRC) and the Center for Social Research in Health (CSRH).

"This research makes it clear we have an [economic model](#) that delivers profits for the wealthiest at the expense of those with least in our community, and it's time for the [inequality](#) in our economic system to be addressed and made fairer for all."

Acting ACOSS CEO, Edwina MacDonald says everyone deserves a roof over their heads, and a home that meets their basic need for shelter.

"It is simply wrong that something so fundamental has become so challenging for those on low and modest incomes to achieve.

"This research also points to the precariousness of life for people on low incomes in Australia, 39% of whom are unable to cover three weeks of lost [income](#). There's also a need to bolster the social safety net so that unemployment does not inevitably lead to poverty."

The report notes that although the situation is markedly worse of late, it isn't new. Between 2003 to 2021:

- home ownership among people aged 25 to 29 fell from 44% to 38% and among people aged 30–34 it fell from 57% to 50%
- the proportion of median household [disposable income](#) required to service a typical home mortgage rose from 27% to 41%
- the proportion of median household disposable income required to pay the median rent rose from 26% to 31%.

Out of almost 50,000 rental listings surveyed by Anglicare Australia in May 2022, only seven were affordable (costing less than 30% of income) for a single adult on Jobseeker Payment. Just nine were affordable for a single parent on Jobseeker Payment with one child.

Previous reports in this series have shown how the early pandemic-related income supports and rental assistance offered by the government helped to lift people out of poverty. This report shows that, with a return to "normal settings" and the end of those supports, mortgage increases and higher rents are putting people on low and modest incomes under incredible financial pressure.

## **Household wealth inequality**

The study found that household wealth in Australia is very unequally

divided.

- The highest 10% of households by wealth has an average of \$6.1 million or 46% of all wealth.
- The next 30% has an average of \$1.7 million or 38%.
- The majority—the lower 60%—has an average of \$376,000 or just 17% of all wealth.

More than 130 billionaires in Australia each hold an average of \$3600 million in wealth.

As there is less inequality in owner-occupied housing wealth than other assets such as shares and investment property, the recent boost to housing wealth eased the growth in wealth inequality underway for the last two decades. The top 10% of households by wealth held 42% of all wealth in 2003, rising to 47% before COVID in 2018, then fell back to 46% in 2021.

This report also shows that due to our high and rapidly growing home prices and relatively easy access to credit, Australian households are overcommitted or "more indebted" than many other wealthy nations. The Organization for Economic Cooperation and Development (OECD) regards households in the lowest 40% by income with debt at least three times their annual disposable income as "over-indebted" and nearly a third of Australia's [low-income households](#) are currently in this position.

## **The report's key findings**

- Households in Australia are on average the fourth richest in the world, but many are financially vulnerable due to high debt or low financial buffers.
- Household wealth grew as much over the past three years as in the previous 15 years. Two-thirds of the increase in wealth came

from house price inflation. Residential property values rose 22% through the year to December 2021—the highest annual increase in 35 years.

- Wealth inequality rose sharply from 2003 to 2018, then declined slightly in the pandemic. Rising [house prices](#) moderated overall wealth inequality, as housing is distributed more evenly across the population than other kinds of wealth, but it shut younger people and those with low incomes out of home ownership.
- Household wealth is still shared very unequally: the richest 10% of households has an average of \$6.1 million and almost half of all wealth (46%), while the lower 60% (with an average of \$376,000) has just 17% of all wealth.

This is the fourth and [final report](#) in the partnership's [Build Back Fairer](#) Series which aimed to help us understand the impacts of the COVID pandemic and government responses to it, on people's incomes, wealth, employment and housing and to assess which groups and regions were most affected.
