

France readies rescue of beluga astray in Seine

August 9 2022, by Benjamin MASSOT

Belugas are a protected species that cannot survive long in fresh water.

French marine experts will attempt Tuesday to rescue a beluga whale that swam up the Seine river and return it to the sea, officials said, a complex and risky operation for an animal already sick and

malnourished.

The four-metre (13-foot) cetacean, a <u>protected species</u> usually found in cold Arctic waters, was spotted a week ago heading towards Paris, and is now some 130 kilometres (81 miles) inland.

"An operation to transport the <u>beluga</u> astray in the Seine will be attempted this evening," said <u>government officials</u> in the Eure department, who are orchestrating the effort.

The animal's progress inland has been blocked by a lock at Saint-Pierre-La-Garenne in Normandy, and its health has deteriorated after it refused to eat.

But its condition is currently "satisfactory", Isabelle Brasseur of the Marineland sea animal park in southern France, Europe's biggest, told AFP.

She is part of a Marineland team sent to assist with the rescue, alongside the Sea Shepherd France NGO.

"What's exceptional is that here the banks of the Seine are not accessible for vehicles... everything is going to have to be done by hand," Brasseur said.

So far the beluga has not turned around, and experts have dismissed any attempt to "nudge" it back toward the English Channel with boats, saying it would stress the weakened animal and probably be futile in any case.

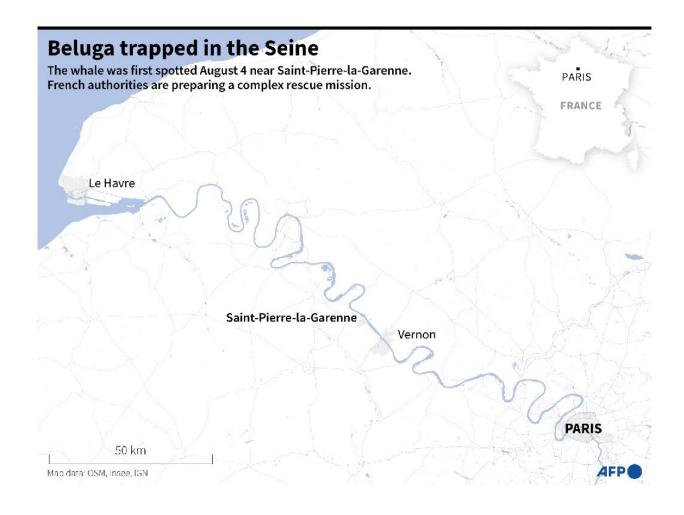

Starting at around 8:00 pm (1800 GMT), the team will try to get the animal weighing 800 kilogrammes (nearly 1,800 pounds) onto a refrigerated truck and drive it to an undisclosed seawater basin where it can be treated for several days before being released into the open sea,

the Eure authorities said.

"There it will, we hope, have a better chance of survival," said NGO Sea Shepherd France, which is assisting the operation, Tuesday.

It added that tranquilisation is not an option, since belugas are so-called "voluntary breathers" that need to be awake to inhale air.

Beluga trapped in the Seine.

'Have to get it out'

"In any case, we have to get it out of there... and try to figure out what is wrong," Brasseur said.

Veterinarians will keep constant watch during the move.

"There may be internal problems that we can't see," she said, despite the fact that belugas are "extremely hardy" as a species.

Interest in the beluga's fate has spread far beyond France, generating a large influx of financial donations and other aid from <u>conservation</u> groups as well as individuals, officials said.

Sea Shepherd on Monday issued an appeal in particular for heavy-duty ropes, nets, mattresses and other equipment.

Belugas are normally found only in cold Arctic waters, and while they migrate south in the autumn to feed as ice forms, they rarely venture so far.

According to France's Pelagis Observatory, specialised in sea mammals, the nearest beluga population is off the Svalbard archipelago, north of Norway, 3,000 kilometres from the Seine.

The trapped whale is only the second beluga ever sighted in France. The first was pulled out of the Loire estuary in a fisherman's net in 1948.
