

NASA Moon launch to attract up to 400,000 visitors

September 3 2022

Tourists on a Florida beach await the launch of NASA's new Moon rocket before it was called off on August 29, 2022.

Up to 400,000 visitors are expected to flock to the Florida coast on Saturday, hoping to catch a glimpse—and hear the roar—of NASA's

rocket launch to the Moon.

If the uncrewed Space Launch System (SLS) lifts off successfully, it will be not only awe-inspiring but historic for NASA, marking the first of its Artemis missions plotting a return to the Moon.

The Kennedy Space Center will be closed to the public, but spectators on local beaches will be able to see the most powerful vehicle that NASA has ever launched climb into the sky.

"I remember being a little kid and some of the (Apollo) lunar landings," Alberto Tirado told AFP on Cocoa Beach, the day before the rocket's scheduled launch.

"So I want to feel that power and what they felt in the 1960s."

On Monday, when a first launch attempt had to be scuttled at the last moment due to [technical issues](#), local Brevard County authorities had expected between 100,000 and 200,000 visitors.

Don Walker, the county's communications director, says that though Monday's numbers have yet to be finalized, they estimate "double that amount on Saturday."

"We are 'guesstimating' the launch viewing crowd to number between 200,000 to 400,000 people," Walker told AFP.

For comparison, SpaceX's first manned launch in 2020—amid the pandemic—drew 220,000 people.

The fact that the launch is scheduled for a weekend, with Monday also a US holiday, means that the crowd is likely to be much larger, said Meagan Happel with the Space Coast Office of Tourism.

As on Monday, traffic is expected to get heavy "three to four hours" before the launch, Happel told AFP.

Liftoff is currently scheduled for 2:17 pm (18:17 GMT) on Saturday, with the potential for up to a two-hour delay if necessary.

Hotels along the coast have been fully booked for several weeks, and there are only a limited number of parking spaces near the best viewpoints.

Artemis 1 is a [test flight](#) without any astronauts on board.

The Orion capsule, after separating from the SLS rocket, will spend about six weeks in [space](#) and travel at one point nearly 40,000 miles (64,000 km) past the Moon—farther than any human-grade vehicle has ever gone.

It is the Orion that will then take future astronauts back to the Moon—including the first woman and the first person color to walk on its surface—in 2025 at the earliest.
