Some people have strong reactions to art and music, others hardly any. In 2020, researchers at the Max Planck Institute for Empirical Aesthetics (MPIEA) in Frankfurt am Main, Germany, developed a method that

scientists can use to predict the general receptivity of potential study participants to aesthetic stimuli. Initially, the Aesthetic Responsiveness Assessment (AReA) was available only in German and English. Now, however, a team of researchers from the MPIEA and Shahid Beheshti University (SBU) in Tehran, Iran, have validated the procedure in Persian (Farsi) as well. Their findings have just been published in the journal *Psychology of Aesthetics, Creativity, and the Arts*.

The AReA questionnaire comprises 14 questions and can be used to screen participants to be selected for empirical aesthetics studies. Divided into three subscales—Aesthetic Appreciation, Intense Aesthetic Experience, and Creative Behavior—the tool allows researchers to determine how strongly a person responds to aesthetic stimuli, such as [music](#), visual art, or [poetry](#).

"People vary quite a bit in how they respond to aesthetic experiences. It is important to consider the role [culture](#) plays in such individual differences, but existing tools for assessing aesthetic responsiveness largely focus on North American and European cultures," explains co-author Julia F. Christensen of the MPIEA.

In an attempt to extend empirical aesthetics research to another culture and language, the researchers developed a new version of the AReA questionnaire, translating it into Persian and adapting it to Persian culture, and then tested it with 1,586 study participants. Altogether, this validation process took more than four years.

Another co-author of the study, MPIEA researcher Edward A. Vessel, describes the outcome: "Our results confirm the reliability of the Persian version of the AReA, which provides a new standard for measuring aesthetic responsiveness in Persian-speaking communities. This will greatly facilitate the development of cross-cultural research in empirical aesthetics."

Due to its political situation, Iran is quite isolated. This isolation nevertheless provides a special opportunity to study aesthetic responsiveness in a country that is little influenced—or influenced only via the internet—by Western culture. The few existing studies that have directly examined the aesthetic preferences of Iranians have identified both significant differences from and similarities to those of Western populations. With the help of the Persian-language AReA questionnaire, this important research can now be developed further and enhanced.
