

Columbia disaster that scuttled the space shuttle

January 30 2023, by Laurence COUSTAL and Janet MCEVOY

Columbia (pictured in December 2002 during preparations for what would turn out to be its final mission) was the oldest shuttle to fly in orbit.

America may now be aiming to put astronauts back on the Moon, but for

years the United States turned its back on manned missions after the Columbia space shuttle disaster.

Its [space program](#) suffered a catastrophic setback when all seven astronauts were killed when the [shuttle](#) broke up on re-entering the Earth's atmosphere 20 years ago on February 1, 2003.

It was the second shuttle disaster after the Challenger explosion of 1986 which also killed the crew and led to sharp criticism of the safety culture at NASA.

The shuttle fleet was grounded for two and a half years and it sparked a major shift in American [space](#) flights.

In 2004, president George W. Bush announced that the eye-wateringly expensive program would be retired.

For years after the last shuttle flight in 2011, NASA found itself dependent on Russia for transport to the International Space Station (ISS) until Elon Musk's Space X began flying passengers there in 2020.

As well as the Moon, Washington is now preparing for a [manned mission](#) to Mars, scheduled tentatively for the late 2030s or early 2040s.

'Trails of smoke'

Columbia broke up at 203,000 feet (61,900 meters) over eastern Texas just as the mission controller in Houston was talking to Columbia commander Rick Husband.

Columbia lifts off from the Kennedy Space Center on January 16, 2003.

"To Columbia, here is Houston... we did not copy your last" message.

After a moment, Husband replied: "Roger but..."

After a brief crackling noise, contact was lost.

Columbia disappeared from radar screens at 9:00 am (1400 GMT), 16 minutes before it was due to land.

The flaming debris from the 80-ton craft was caught streaking across the sky over the southern US by local TV stations, with parts scattered over Texas and Louisiana.

Bob Molter from Palestine, Texas, told National Public Radio how he saw the shuttle break up in the sky.

"There was a big boom that shook the house for more than a minute, and I went outside because I thought there had been a train accident on the nearby line.

"But there was nothing, and then I looked up and saw the trails of smoke zig-zagging, going across the sky."

A memorial at the Houston Space Center in Texas, on February 7, 2003.

Heroes

Columbia was the oldest shuttle to fly in orbit.

When it took off on its 28th flight on January 16, 2003 for a 16-day mission to carry out experiments it had been in operation for over 20 years.

Flight STS-107 was launched under extremely tight security in the wake of the September 11, 2001 attacks and due to the presence on board of Israel's first astronaut, Ilan Ramon.

Bush cut short a stay at the Camp David presidential retreat and raced back to Washington following the tragedy. In a televised address he hailed the crew, two of whom were women, as heroes.

A probe revealed that the shuttle disintegrated due to damage caused by a piece of foam from the external fuel tank that took a chunk out of the orbiter's left wing during liftoff.

This left it unable to withstand the [extreme temperatures](#) generated by re-entry.

Debris of the Space Shuttle Columbia pictured two days after it broke up upon re-entry on February 1, 2003.

End of shuttle program

The shuttle program was born in 1972 under president Richard Nixon and went on to become the major focus of US human spaceflight ambitions over the next four decades.

The fleet also acted like space trucks, carrying more than 1,500 tons of

equipment to help build the first space telescope, Hubble, and the International Space Station.

After the Columbia disaster, NASA underwent sweeping changes aimed at improving its culture and safety.

The agency resumed shuttle flights in July 2005, with Discovery, then Endeavour and finally Atlantis continuing to fly missions to the ISS until 2011.
