

'Out of control' fires endanger wildlife in Brazilian wetlands

November 15 2023

Smoke clouds billow over Brazil's Pantanal wetlands.

The Pantanal wetlands in western Brazil are famed as a paradise of biodiversity, but these days they have enormous clouds of smoke billowing over them, as raging wildfires reduce vast expanses to

scorched earth.

Known for its lush landscapes and vibrant wildlife, including jaguars, caimans, macaws and monkeys, the Pantanal is home to the world's biggest tropical wetlands and, in normal times, a thriving ecotourism industry.

But in recent weeks it has been ravaged by fires that are threatening its iconic wildlife, as Brazil suffers through a southern hemisphere spring of droughts and [record heat](#).

There were 2,387 fires in the Pantanal in the first 13 days of November, an increase of more than 1,000 percent from the entire month of November 2022, according to satellite monitoring by Brazilian space research agency INPE.

"The situation is completely out of control. And between the [heat wave](#) and the wind, it's only going to get worse," says biologist Gustavo Figueiroa, 31, head of the environmental group SOS Pantanal.

"The Pantanal is a region that's used to fires. Normally, it regenerates naturally. But this many fires isn't normal."

The Pantanal sits at the southern edge of the Amazon rainforest, stretching from Brazil into Bolivia and Paraguay across more than 170,000 square kilometers (65,000 square miles).

Weeks of wildfires have devastated the Pantanal, the world's largest tropical wetlands.

It has been hit hard by drought this year, with normally flooded areas reduced to shriveled ponds.

At one such spot along the dirt highway across the region, the 150-kilometer (95-mile) "Transpantaneira," a small group of caimans can be seen trying to swim in the shallow water.

Nearby, the corpse of another sits rotting on the bank.

Elsewhere, a dead porcupine lays on a carpet of ash in the charred remains of what was once a forest.

"It probably died of [smoke inhalation](#)," says veterinarian Aracelli Hammann, who is volunteering with a wildlife rescue group.

They made the grim find in the Encontro das Aguas park, home to the world's largest jaguar population.

Nearly one-third of the park has been hit by fires in the past month, according to environmental group ICV.

The other main front that firefighters are battling is in the Pantanal National Park to the southwest, where fires have burned 24 percent of the surface area.

Veterinarian Aracelli Hammann holds a dead porcupine killed in the fires.

A dead caiman killed in the fires ravaging the Pantanal.

A kingfisher sits on a branch of a scorched tree.

Volunteers leave food for animals affected by the fires.

Figueiroa warns the two fire fronts "are about to merge."

Exacerbating the situation, firefighters face huge logistical battles, given that many hard-hit areas are only reachable by boat.

'Domino effect'

Experts say the fires are mainly caused by human activity, especially burning land to clear it for farming.

Climate conditions have only made things worse.

Experts say even when animals survive the flames, they risk starvation.

"We've seen a range of dead animals, including insects, reptiles, amphibians, [small mammals](#), which are unable to flee," says Figueiroa.

"They're part of an invisible food chain, and each death has a domino effect, reaching all the way up to the apex predator, the jaguar."

In a clearing, a group of monkeys rushes to devour bananas and eggs left for them by volunteers.

"We call it 'gray hunger'—when [fire](#) reduces all the vegetation to ashes and there are no natural food sources left in the area for animals that survive the flames," says Jennifer Larreia, 33, head of animal rescue group E o Bicho.

In 2020, when wildfires also devastated the region, her organization provided 300 tonnes of fruit for animals in five months.
