

Moon age daydream: modern lunar exploration

January 17 2024

Japan, whose unmanned "sniper" probe [will attempt a lunar landing on Saturday](#), is one of many countries and private companies launching new missions to the moon.

It is a feat so far only achieved by four nations—the United States, the Soviet Union, China and most recently India—with spacecraft often losing communication or crash-landing.

The modern lunar exploration programs include plans to put people on the [moon](#) for the first time since 1972 and eventually establish bases there.

Here is a rundown of the latest moonshots:

United States

The first country to land on the moon wants to build a sustained presence there as a pitstop for missions to Mars.

But it has faced two setbacks this month, as NASA postponed plans for crewed lunar missions and a private lander had to turn back after leaking fuel.

Under NASA's Artemis program, astronauts had been due to fly around the moon this year but the mission has been pushed back to 2025 to allow for extra safety checks.

A third Artemis voyage—to put the first woman and first person of color on lunar soil—is now scheduled for 2026 instead of 2025.

Even that may be optimistic, because the Artemis 3 lander, a modified version of SpaceX's next-gen Starship rocket, has exploded in two test flights.

NASA says commercial tie-ups give it "more shots on goal" although its Peregrine lunar lander, made by US company Astrobotic, failed when it lost fuel after take-off.

The next attempt, by Texas-based Intuitive Machines, launches in February.

India

"India is on the moon!" the country's space agency chair announced to cheers at [mission control](#) in August after Chandrayaan-3 became the first craft to land near the moon's south pole.

The unmanned mission orbited Earth several times to build up speed for its journey, resulting in a historic triumph for India's ambitious, cut-price [space program](#).

In 2014, India became the first Asian nation to orbit a probe around Mars, and Chandrayaan-3 followed a successful launch into [lunar orbit](#) in 2008 and a failed moon landing in 2019.

The Indian Space Research Organisation (ISRO) has a dozen missions planned for 2024, including preparation for a three-day trip into Earth's orbit—its first crewed [space flight](#).

Russia

The Luna-25 mission in August was meant to mark Russia's return to independent lunar exploration, nearly half a century after the Soviet Union last landed on the moon.

But the lander crashed on the moon's rocky surface, where it had been supposed to collect samples and analyze soil for one year.

The failure dealt a blow to Moscow's hopes of building on the legacy of the Soviet-era Luna missions, as financial troubles and corruption

scandals plague its space program.

President Vladimir Putin has also been working to strengthen space cooperation with China after ties with the West broke down following Russia's 2022 invasion of Ukraine.

China

The world's second-largest economy has pumped billions of dollars into its military-run space program as China chases its "space dream" under President Xi Jinping.

A decade since the Chang'e-3 became the first Chinese spacecraft to land on the moon, the country is now pursuing plans to send a crewed mission by 2030 and build a base there.

In 2019, the unmanned Chang'e-4 landed on the far side of the moon, and a year later, Chang'e-5 brought the first lunar samples to Earth in more than 40 years.

In October, the country sent a fresh team to its Tiangong space station in the latest crewed [mission](#) for the fast-growing [space](#) program.

Japan

Japanese company ispace attempted a soft [lunar landing](#) in April last year but crashed, becoming the third private entity to have failed in the endeavor.

Space agency JAXA has suffered a run of bad luck, losing communication with its Omotenashi lunar probe carried on Artemis 1 in 2022.

It has also seen failures after lift-off of the next-generation H3 launch rocket and the normally reliable solid-fuel Epsilon rocket.

So hopes are high for a successful touchdown on Saturday of its Smart Lander for Investigating Moon (SLIM), nicknamed the "Moon Sniper" for its precision landing capabilities.

The pressure is on, however, as countries from South Korea to the United Arab Emirates ramp up efforts to be the next to make lunar history.
