Spring is traditionally the season for a good clean—and maybe a clear out. Taking stock and having a bit of a declutter can [freshen things up domestically](#).

One popular new way [of doing this](#) involves targeting your wardrobe by making digital inventories of your clothes—and then tracking what you wear. You note the price, [brand](#) and category of your garments (and shoes and bags) and then record how much use they get.

The idea is that having this information can then lead to better choices in the future, whether that's saving money or having a more sustainable approach to fashion.

And [better choices are needed](#). The [clothing industry](#) in Europe is ranked fourth in terms of its detrimental [environmental impact](#) after housing, transport and food.

Clothing is heavily underused, with the number of times a garment gets worn reportedly [decreasing by 36%](#) globally between 2000 and 2015. In the UK it has been estimated that 65% of women and 44% of men have clothing in their wardrobe which they [are yet to wear](#), while one survey found that many women consider garments worn once or twice [to be "old"](#).

So while brands compete with [online services](#) to offer ever increasing amounts of clothing to consume, amid popular tools to sell the clothes you no longer need, we wondered whether digital tracking could make your wardrobe more sustainable.

For [our research](#), we worked with Save Your Wardrobe, an app designed to help people organize and categorize their clothes. We interviewed users to find out if digitizing their wardrobes led to any noticeable changes.

From the start, we found consumers feeling anxious and dissatisfied with their clothing behaviors and wardrobe management. There was an aspiration to better understand what was in their wardrobes and how they

used their garments.

One woman told us, "Personally I would feel happier if I felt like I was making really thoughtful decisions [about what clothes I buy] and they weren't coming from a place of anxiety, or a place of feeling constantly like there is some new gap in my wardrobe that I have to fill."

Another said, "I think a lot about reducing the eco footprint of my lifestyle. And I think clothing is one area where I get frustrated because I don't feel like my values line up with my behavior."

She added, "I feel like we should just consume less, but then I can get anxious and stressed out and feel like I need something, and those two things are incompatible."

## **Make do and mend**

For many, the initial process of organization required to upload photos of garments to the app became a moment of reflection and an opportunity to challenge and change existing patterns of behavior. The effort involved also resulted in a sense of appreciation of the clothing which was already owned.

An important aspect of this was the ability to quantify what was in the wardrobe—and many of the people we spoke to were surprised (or even shocked) by the amount of clothing they possessed.

One said, "I realized that 50% of my wardrobe is from Primark. It's ridiculous and I was like, 'Oh my God!'"

She continued, "I knew that when I go to Primark I go crazy but I didn't have a full overview of all the things I have."

Another commented, "I definitely felt more organized. Revisiting old clothes made me see what I have in my closet. That was good, because I [had been] wanting to buy something new, but realized I don't need to."

This kind of reaction was common, as users of the app came to understand—and seek to change—their patterns of behavior around clothing. Items were rediscovered and brought back into use in a way that made owners feel they were "shopping from their own wardrobes."

As they realized how much money they had spent on clothes, some pieces were put aside for repair so they could be worn again, while others were given away.

Overall, we found that consumption of clothing is fueling consumer anxiety—but that using an app can help people feel more in control of their wardrobes. Tracking data about their behavior gave consumers a sense of being more in control of their actions and where they could make changes.

The chance to quantify and gain insight in this way was viewed as similar to other digital solutions—like [wearable fitness trackers](#) that record data and can provide motivational encouragement.

Being more aware of the clothes they already owned made a difference to people's appetites for owning more. So, with a climate change crisis, and when incomes are being squeezed by the cost of living, perhaps it's time to ditch the shopping apps—and spend some time becoming reacquainted with the clothes you already own.
