

in Hunan.

Mitochondrial genome (mtDNA) research has also been applied to plant conservation and genetic improvement. In Gesneriaceae, mtDNA of only two species has been reported.

Researchers from the Wuhan Botanical Garden of the Chinese Academy of Sciences, in collaboration with researchers of Hunan Normal University, completed the sequencing and assembly of the complete mtDNA of *P. hunanensis* for the first time by using the latest sequencing technology with the advantage of long-reads (Nanopore).

The [results](#) were published in *BMC Genomics* titled "Assembly and comparative analysis of the initial complete [mitochondrial genome](#) of *Primulina hunanensis* (Gesneriaceae): a cave-dwelling endangered plant."

The researchers analyzed the mtDNA features of *P. hunanensis*, including gene content, codon usage preference, repetitive sequences, RNA editing, and comparative phylogenetic relationships and genome covariance with the published mtDNA in Labiatae.

They found that the mtDNA of *P. hunanensis* was 575,242 bp in total length, with a GC content of 43.54%. Long-read data supported the assembly into a linear structure encoding a total of 60 genes, including 37 protein-coding genes, 20 transfer RNA genes, and three ribosome RNA genes.

The phylogenetic associations of *P. hunanensis* alongside 32 other plant species. Phylogenetic tree constructed by maximum likelihood method based on 26 conserved mitochondrial genomic PCGs. Credit: WBG

In addition, [protein-coding genes](#) accounted for 9.32% of the total mtDNA length, and a total of 31 codons had relative synonymous codon

usage values greater than 1.116 simple repeats, seven tandem repeats, and 362 dispersed repeat sequences were detected, and 455 potential RNA editing sites were identified.

Covariance results indicated a large number of genomic rearrangements between *P. hunanensis* and closely related species. The topology of the mitochondrial genome-based phylogeny showed that *P. hunanensis* was closely related to *Boea hygrometrica*.

This is the first complete mtDNA within *Primulina* and the third complete mtDNA within Gesneriaceae to be reported, which is an important addition to the limited plant mtDNA database.
