

# Greek port grapples with flood of dead fish

August 28 2024

---

Dead fish floating in the port of Volos, central Greece, on Wednesday.

Authorities in central Greece are racing to deal with an inundation of tons of dead fish at a popular port that locals say could threaten their livelihoods.

It is the second environmental catastrophe to hit the port of Volos, a

three-and-a-half-hour drive north of Athens, after catastrophic floods hit the Thessaly region last year.

Those floods refilled a nearby lake that had been drained in 1962 in a bid to fight malaria, swelling it to three times its normal size.

"After the storms Daniel and Elias last autumn, around 20,000 hectares (50,000 acres) of plains in Thessaly were flooded, and various freshwater fish were carried by rivers" to the sea, Dimitris Klaudatos, a professor of agriculture and environment at the University of Thessaly.

Since then the lake waters have receded drastically, forcing the [freshwater fish](#) toward the Volos port that empties into the Pagasetic Gulf and the Aegean Sea, where they cannot survive.

On Tuesday alone, authorities removed 57 tons of the [dead fish](#) washed up on beaches near Volos, with [cleanup efforts](#) continuing on Wednesday.

Tourist traffic to the area has already plunged by nearly 80 percent since last year's flooding, according to the local association of restaurants and bars.

A crane removes the mass of dead fish on the Xiria River near Volos, Greece.

"The situation with this dead fish will be the death of us," said Stefanos Stefanou, the president of the association. "What visitor will come to our city after this?"

Local authorities have opened an inquiry to study water qualities and microbial levels in the estuary of Lake Karla, as well as potential pollution in the gulf.
