

Birth control prescribed for Hong Kong monkeys

May 6 2011, by John Saeki

A rhesus macaque monkey, seen here drinking from a bottle in Hong Kong. Wildlife experts say monkeys come into conflict with humans when their natural habitat in forests is destroyed.

Wild monkeys don't seem to care that Hong Kong is a concrete jungle -- they thrive so well on its fringes that the government has introduced birth control to curb a population boom.

Easy food handouts from some of the city's seven million humans helped

push macaque numbers to more than 2,000 in recent years -- and a rise in nuisance complaints about monkeys that have lost a natural fear of people.

"I think we still have plenty of space for wildlife. But the countryside and the city are adjacent to each other and sometimes there is conflict," said Chung-tong Shek of the government's conservation department.

Reports of aggressive monkeys chasing hikers for food, grabbing bags and reaching for pockets surfaced in recent years as the macaque population grew.

Stray monkeys with an acquired taste for human food still occasionally run about the crowded shopping districts of the city.

In April, one found its way to central Kowloon, near a strip of camera shops, hotels and fashion boutiques known locally as the Golden Mile.

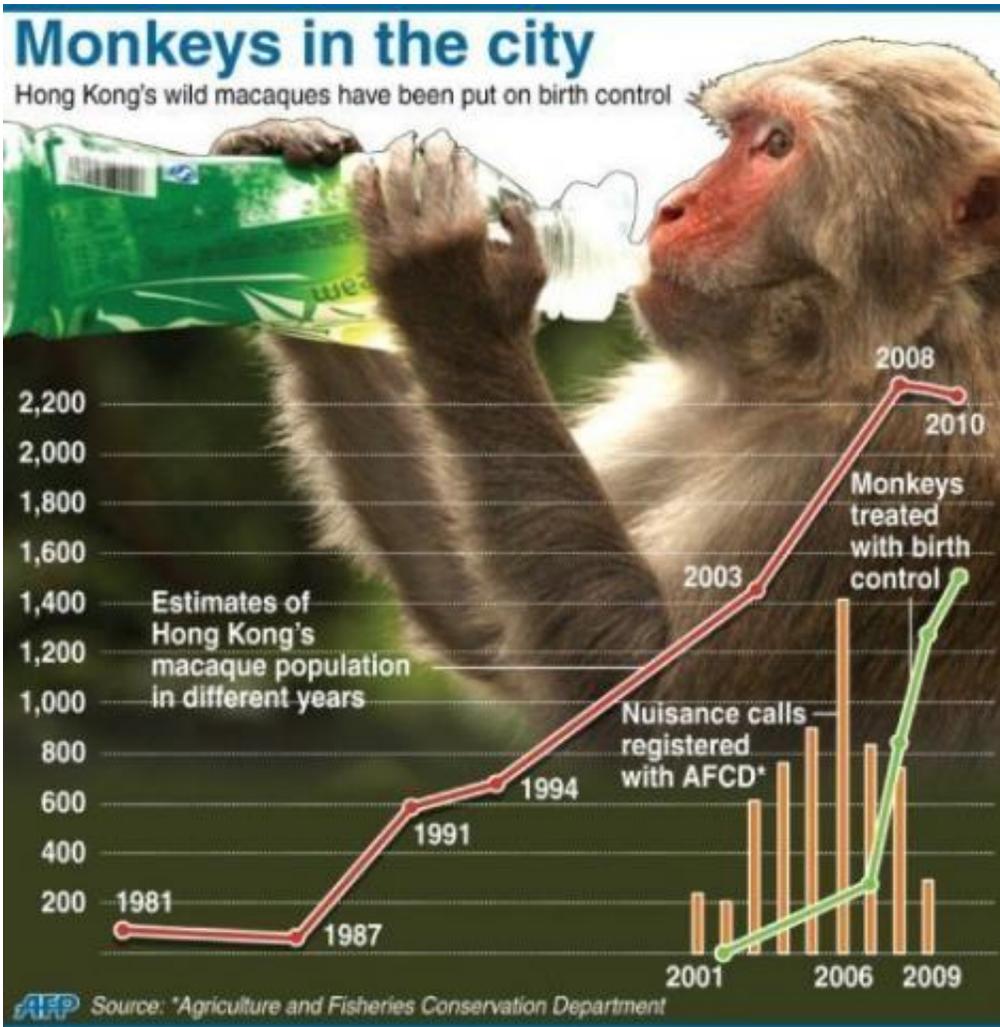

"There is plenty of food inside the city in the garbage. Some of them get lost in the city...from time to time," Shek told AFP.

A decade-old feeding ban with the threat of a maximum HKD10,000 (\$1,287) fine hardly dented the volumes of food on offer from well-wishers and tourists. So the government turned to [birth control](#).

Early field tests were carried out in 2002, in the world's first contraceptive programme targeting a citywide population of macaques, using methods including vasectomies on males and temporary injections on females.

Now the programme focuses on the sterilisation of females, which is done about twice a month, bringing the total of monkeys permanently or temporarily neutered to more than 1,500.

The first problem was catching the monkeys.

Charts showing the population of monkeys in Hong Kong, as well as the proliferation of nuisance complaints in recent years, and the number monkeys neutered in a birth control programme

All the monkeys are on the Kowloon peninsula especially around Kam Shan and Lion Rock country parks, with some outlying groups on the northwestern side of the territory.

"It's very hard for people to catch a monkey. We tried everything," said Sally Kong, a spokeswoman for the conservation department.

Net-guns, cage traps, live decoys, snares and dart guns were all used. But most methods could only be used a few times before the animals got wise to them.

Before long, monkeys even learned to recognise individual conservation department staff members and their vehicles, and avoided them all together.

Now large, baited cages are left open for days at a time, supplied by human feeders known and trusted by the monkeys.

"That way when we trap them in there they don't panic. They just keep on eating as they've been in there many times before," said Paolo Martelli, chief veterinarian with the Ocean Park Conservation Foundation, which is contracted to carry out the sterilisations.

"What we do is remove the tubes. Between the uterus and the ovaries there are small tubes that we cut out in very precise keyhole surgery. We go in, remove two pieces of tube and come out. It takes a few minutes," Martelli said.

"It's beneficial to maintain their ovaries intact because of the very important hormonal role they play," he explained.

A young macaque is seen here carrying a banana at a country park in Hong Kong. Wild monkeys don't seem to care that Hong Kong is a concrete jungle -- they thrive so well on its fringes that the government has introduced birth control to curb a population boom.

Experts working on the project say the contraception plan is not about eliminating the macaques but is a conservation measure that makes it possible for the wild animals to continue existing on the city boundaries.

The programme has received backing from independent animal rights groups.

"Contraceptives are so much better than poisonings or other lethal methods that cause animals so much suffering," said Ashley Fruno, spokeswoman for People for the Ethical Treatment of Animals in the Asia-Pacific region.

"This is another great example of non-lethal methods used to control wildlife populations."

A monkey is being given a health check during a vaccination and general welfare check by the Agriculture, Fisheries and Conservation Department at a country park in Hong Kong. Wild monkeys don't seem to care that Hong Kong is a concrete jungle -- they thrive so well on its fringes that the government has introduced birth control to curb a population boom.

The monkeys seen today in Hong Kong are believed to be the descendants of a few rhesus macaques released early last century to eat

poisonous plants around a newly built reservoir supplying drinking water for the city.

The Strychnos plants are poisonous to humans but a favourite food for macaques, the conservation department says.

There isn't a specific target number for the city's wild monkey population, Shek told AFP, but nuisance calls have dropped from a peak of 1,400 in 2006 to less than 200 in the last couple of years.

"It really depends on what people can tolerate. Sometimes sighting a monkey is the reason for a person to call. This would be recorded as a nuisance complaint even if the monkey hasn't done anything," said Karthi Martelli, project manager with the Ocean Park conservation group.

"I always tell people: mind your monkey manners. When you're scared you do stupid things and people blame the [monkeys](#). If you ignore the monkey and walk away they get bored too. They don't plot to attack," she said.
