President Barack Obama is taking climate change efforts into his own hands, proposing sweeping steps to limit heat-trapping pollution from coal-fired power plants.

Obama will unveil his climate plan Tuesday in a speech at Georgetown University. It's Obama's most prominent effort yet to deliver on one of his major priorities. None of the steps require congressional approval.

The [linchpin](#) of the plan is the first-ever [carbon dioxide emission](#) limits on new and existing power plants.

The White House says Obama hopes to generate enough electricity from renewable energy projects on public lands to power the equivalent of 6 million homes by 2020. He'll set higher goals for renewables installed at federal housing projects.

Obama is also announcing \$8 billion in federal loan guarantees to spur investment in carbon-reducing technologies.
