Provided by McGill University

A new global map of the world's wetlands has been produced by an international research team led by former master's student Etienne Fluet-Chouinard and Prof. Bernhard Lehner of McGill's Department of Geography. In a paper published in the journal *Remote Sensing of Environment*, the researchers present a method producing a map in finer detail than previously available.

This is made possible by using topographic information combined with [satellite measurements](#) generated by French collaborators from the Laboratoire d'Etudes du Rayonnement et de la Matière en Astrophysique et Atmosphères and Estellus.

The map represents a long-term baseline of the world's wetland areas, including areas of artificial inundation and some waterlogged soils, based on measurements made between 1993 and 2004. "This [map](#) represents a great asset for scientists to study large inundation patterns and [wetland ecosystems](#) at the global scale," says Fluet-Chouinard, now a PhD Student at the University of Wisconsin-Madison's Center for Limnology.

More information: Fluet-Chouinard, E., Lehner, B., Rebelo, L.M., Papa, F., Hamilton, S.K., (2015) "Development of a global inundation map at high spatial resolution from topographic downscaling of coarse-scale remote sensing data," *Remote*
