

Can Apple to live up to the hype for the iPhone X?

3 November 2017, by Michael Liedtke And Tali Arbel

The iPhone X's lush screen, facial-recognition skills and \$1,000 price tag are breaking new ground in Apple's marquee product line.

Now, the much-anticipated device is testing the patience of consumers and investors as demand outstrips suppliers' capacity.

Apple said Thursday that iPhone sales rose 3 percent in the July-September quarter, a period that saw the iPhone 8 and 8 Plus come out in the final weeks. Sales could have been higher if many customers hadn't been waiting for the iPhone X, which comes out Friday.

Apple shipped 46.7 million iPhones during the period, according to its fiscal fourth-quarter report released Thursday. That's up from 45.5 million at the same time last year after the iPhone 7 came

out, but represents a step back from the same time in 2015, when Apple shipped 48 million iPhones during the quarter.

As with recent quarters, one of the main sources of Apple's growth is coming from its services, which are anchored by an app store that feeds the iPhone and other devices.

Revenue in that division surged 34 percent to \$8.5 billion during the July-September period. All told, Apple earned \$10.7 billion on revenue of \$52.6 billion, compared with a \$9 billion profit on revenue of \$46.9 billion a year earlier.

Apple shares were up 2.7 percent in after-hours trading.

Nonetheless, the just-ended quarter largely became an afterthought once Apple decided to release the iPhone X six weeks after the iPhone 8. The company was optimistic.

"The Super Bowl for Apple is the iPhone X," GBH analyst Daniel Ives said. "That is the potential game changer." "As we approach the holiday season, we expect it to be our biggest quarter ever," CEO Tim Cook said on an earnings call with analysts Thursday. He added that the company is increasing its iPhone X production capacity every week.

But it also brings a potential stumbling block. While conspiracy theorists might suspect that Apple is artificially reducing supply to generate buzz, analysts say the real reason is that Apple's suppliers so far haven't been able to manufacture the iPhone X quickly enough.

On Thursday, Apple predicted revenue for this quarter from \$84 billion to \$87 billion. Analysts, who have already factored in the supply challenges, expect \$85.2 billion, according to FactSet.

Making the iPhone X is proving to be a challenge because it boasts a color-popping OLED screen, which isn't as readily available as standard LCD displays in other iPhone models. The new iPhone also requires more sophisticated components to power the facial-recognition technology for unlocking the device.

Analysts are expecting Apple to ship 80 million iPhones during the current quarter, which includes the crucial holiday shopping season, according to FactSet. That would be slightly better than the same time last year.

Even with the iPhone X's delayed release, Apple is still struggling to catch up. Apple is now giving delivery times of five to six weeks for those ordering in advance online (limited supplies will be available in Apple stores for the formal release Friday). Most analysts are predicting Apple won't be able to catch up with demand until early next year.

Apple is counting on the iPhone X to drive even higher-than-usual sales during the first nine months of next year—a scenario that might not play out if production problems persist and impatient consumers turn instead to phones from Google or Samsung.

"What Apple needs to do is manage consumer expectations so they don't get frustrated having to wait for so long for a new phone," Ives said.

Analysts believe Apple can pull off the juggling act. They are expecting the company to sell 242 million iPhones in the fiscal year ending in September 2018—the most in the product's history. The previous record was set in 2015 when Apple shipped 231 million iPhones, thanks to larger models introduced just before the fiscal year began. By comparison, Apple shipped nearly 217 million iPhones in its just-completed fiscal 2017.

If Apple falters, investors are likely to dump its stock after driving the shares up by 45 percent so far this year on the expectation that the iPhone X will be the company's biggest hit yet.
