Self-healing material a breakthrough for bio-inspired robotics
21 May 2018

A digital clock continues to keep time as damaged circuits instantaneously heal themselves, rerouting electrical signals without interruption. Credit: Nature Materials

Circuits produced with conductive traces of this material remain fully and continuously operational when severed, punctured, or had material removed.

Applications for its use include bio-inspired robotics, human-machine interaction, and wearable computing. Because the material also exhibits high electrical conductivity that does not change when stretched, it is ideal for use in power and data transmission.

"Other research in soft electronics has resulted in materials that are elastic and deformable, but still vulnerable to the mechanical damage that causes electrical failure," said Carmel Majidi, an associate professor of mechanical engineering. "The unprecedented level of functionality of our self-healing material can enable soft-matter electronics and machines to exhibit the extraordinary resilience of soft biological tissue and organisms."

Majidi, who directs the Integrated Soft Materials Laboratory, is a pioneer in developing new classes of materials in the field of soft matter engineering.

"If we want to build machines that are more compatible with the human body and the natural environment, we have to start with new types of materials," he said.

Majidi holds a courtesy appointment in the Robotics Institute. Other authors include Eric Markvicka and Xiaonan Huang of Carnegie Mellon University, and Michael D. Bartlett of Iowa State University.
