

NASA finds tropical storm Wukong's comma shape

23 July 2018

thunderstorms extending from the eastern quadrant, giving the [storm](#) a comma-shaped appearance.

At 5 a.m. EDT (0900 UTC) the Joint Typhoon Warning Center or JTWC noted that Tropical Storm Wukong had maximum sustained winds near 45 knots (51.7 mph/83.3 kph). It was located near 26.1 degrees north latitude and 159.4 degrees east longitude, about 315 nautical miles east-northeast of Minami Tori Shima, Japan. Wukong continued moving north at 10 knots (11.5 mph/18.5 kph).

The JTWC forecast calls for Wukong to move generally north. The JTWC expects Wukong to strengthen to 60 knots (69 mph/111.1 kph) before turning extra-tropical to the east of Japan.

NASA's Aqua satellite caught this visible light image of Tropical Storm Wukong in the Northwestern Pacific Ocean on July 22 at 10:55 p.m. EDT (July 23 at 0255 UTC). Credit: NASA/NRL

Tropical Depression 14W formed on July 22 and the next day, NASA's Aqua satellite captured an image of the storm that had strengthened into a tropical storm and taken on a comma shape.

Tropical Depression 14W was renamed Wukong when it became a [tropical storm](#) at 5 p.m. EDT (2100 UTC) on July 22.

The Moderate Resolution Imaging Spectroradiometer or MODIS instrument aboard NASA's Aqua satellite caught a visible light image of Tropical Storm Wukong on July 22 at 10:55 p.m. EDT (July 23 at 0255 UTC). The MODIS image showed powerful thunderstorms around the low-level center of circulation and a band of
