

How partisan politics could take a bite out of your wallet

16 April 2019

When individuals lack the skill or time to build an investment portfolio, they frequently invest in mutual funds. Ideally, mutual funds maximize client wealth by investing their clients' assets in funds that best match the client's investment strategy (low-risk, short-term, etc.).

However, research by SDSU finance professor, Dr. Yaoyi Xi, and Dr. M. Babajide Wintoki of the University of Kansas, indicates that one of the factors influencing how mutual fund managers invest their clients' money may have more to do with how they vote than with a stock's performance.

The research, which is slated for publication in the *Journal of Financial and Quantitative Analysis*, determined the political affiliations of the managers of 1,298 active mutual funds and the top executives of 16,655 firms in which they invest by viewing political contribution records compiled between 1989 and 2016. For example, they found that Republican-leaning fund managers invested about 8 percent more into Republican-leaning firms and about 3 percent less into Democratic-leaning firms than Democratic-leaning fund managers.

"When we investigated further, we found that partisan-leaning fund-managers allocate about 43 percent of their assets to firms whose executives have similar political leanings," said Xi. "We also found that they allocate only 33 percent of their assets to firms with the opposite political leanings."

Xi and Wintoki also studied how fund managers invested assets within various industries during a number of presidential administrations. For example, when Republicans hold the presidency, they may favor oil investments, but when a Democrat holds the presidency, they may favor renewable energy investments. To account for this they controlled for the fact that mutual fund managers' preferences might change over time, and still detected partisan [bias](#) among fund

managers' portfolios. Furthermore, they showed that the partisan bias among fund managers tends to be exacerbated when the party they favor holds the presidency.

But how does this work out for investors?

Not great, according to the research. "We find that [mutual funds](#) that have more holdings in politically similar firms tend to perform worse than those with less partisan bias," the study reported.*

"Specifically, we found that funds with more partisan bias suffer from higher levels of idiosyncratic volatility compared to those with less bias. Therefore, our findings suggest that funds with more partisan bias generate less return for the risks associated with their portfolios," said Xi. "Given that [fund managers](#) are tasked with implementing strategies to increase their clients' wealth, the real and significant cost of partisan bias in mutual fund portfolio allocation is worth of investors' scrutiny, to say the least."

More information: *Partisan mutual fund investments accounted for a loss of between 1-to-5 percent compared to non-partisan mutual fund investments.
