Environmental cost of 'fast fashion' is not sustainable
8 April 2020

Urgent fundamental changes to 'fast fashion' clothing items which are treated by many as disposable is needed to stem a devastating impact upon the environment according to scientists.

The fashion industry is the second largest industrial polluter after aviation, accounting for up to 10% of global pollution. Despite the widely publicized environmental impacts, however, the industry continues to grow, in part due to the rise of fast fashion, which relies on cheap mass-manufacturing, frequent consumption and short-lived garment use.

A new research paper published in Nature Reviews Earth and Environment reviews state-of-the-art research to examine the environmental impacts at critical points in the textile and fashion value chain from production to consumption, focusing on water use, chemical pollution, carbon emissions and textile waste.

Impacts from the fashion industry include, over 92 million tonnes of waste produced per year and 1.5 trillion litres of water consumed, alongside chemical pollution and high levels of CO₂ emissions.

Dr. Patsy Perry from The University of Manchester said: "We highlight the need for urgent and fundamental changes in the fashion business model to minimize and mitigate the detrimental environmental impacts."

"A transition away from fast fashion toward slow fashion requires a slowdown in manufacturing volumes, the introduction of sustainable practices throughout the supply chain and a shift in consumer behavior to reduce the amount of new clothing being purchased and increase garment lifetimes. Such systemic changes could improve the long-term sustainability of the fashion supply chain."

A solution to the negative environment cost would require substantial changes in the industry. A move towards 'slow fashion' would encourage the industry to focus on more sustainable practices, including the deceleration of manufacturing and an emphasis on better-quality materials which last longer.

Kirsi Niinimäki, co-author of the paper and Associate Professor at Aalto University said: "Slow fashion is the future, but we need a new system-wide understanding of how to transition towards this model, requiring creativity and collaboration between designers and manufacturers, various stakeholders, and end consumers."

As well as industry required to be open to adopting large-scale changes in practice, consumers also have a crucial role and must change their consumption habits.
