A new species of dinosaur identified by Mexican paleontologists is believed to have been "very communicative" and used low-frequency sounds like elephants to talk to each other, a researcher said Friday.

The specimen, which has been named Tlatolophus galorum, is thought to have died around 72 million years ago in what is now Mexico's northern state of Coahuila.

"We believe that these dinosaurs were very communicative. They even produced and perceived low-frequency sounds like those made by elephants, which travel several kilometers and are imperceptible to humans," added Ramirez.

These "peaceful, but talkative" dinosaurs could also have had the ability to emit loud sounds to scare off predators, the National Institute of Anthropology and History (INAH) said on Thursday when it announced the discovery.

Mexican researchers think Tlatolophus galorum's crest may have been red.

"We believe that these dinosaurs, like modern birds, saw in color and so these structures like the crest were possibly brightly colored. They could have been completely red, or multi-colored, with spots," Ramirez said.

The discovery is still under investigation, but research about the ancient reptile has already been published in the scientific journal *Cretaceous Research*, according to the INAH.

"It is an exceptional case in Mexican paleontology," it said. "Highly favorable events had to occur millions of years ago, when Coahuila was a tropical region, for it to be conserved in the conditions it was found in."

The name Tlatolophus is derived from tlahtolli—which means word in the indigenous Nahuatl language—and lophus, meaning crest in Greek, the researchers said.
