

Women have played major role in history -- from the start, authors assert

6 February 2007

Hold on to your bearskin hats and your macramé snoods, readers: You are in for a wild verbal ride through your deep, deep past.

The authors of a new book have fashioned a 16-chapter prehistory theme park worthy of Disney, but in their confection, lame, even egregious, past assumptions about our past are hunted down and slain, and stars – in the form of womankind – are born.

"The Invisible Sex: Uncovering the True Roles of Women in History" (Smithsonian Books/Collins) is a roller coaster ride through Homo sapiens' unsteady past. No stone tool is left unturned to bring us up on what is – and what is not – probable about our long and miraculous journey.

The authors are archaeologists J.M. Adovasio, the founder and director of the Mercyhurst Archaeological Institute; Olga Soffer, a professor of anthropology at the University of Illinois at Urbana-Champaign; and Jake Page, a freelance writer. Adovasio is an expert on perishable prehistoric artifacts; Soffer is an expert on the Paleolithic Period and peoples of the Old World.

Of greatest import in this book is the idea that women have always been major players – not simply baby-machines who tended to the children, rustled up roots, collected nuts and berries and relied on macho male hunters to bring home the bacon.

In fact, the authors' spadework led them to a striking conclusion: that "female humans have been the chief engine in the unprecedented high level of human sociability; were the inventors of the most useful of tools – called the String Revolution; have shared equally in the provision of food for human societies; almost certainly drove the human invention of language; and were the ones who created agriculture."

Upfront they assert that the stereotypical image of early woman comes mainly from modern males who until the last few decades "have dominated the fields of anthropology and archaeology," fixated on stones and bones and "assumed that it was a man's world back in the Pleistocene and earlier."

The consequence: "Women were largely ignored," the authors wrote, conceding that "the bias was, in a sense, self-fulfilling, but it was more an unconscious bias than a deliberate and nasty plot against women."

Over recent years, new archaeological techniques and technologies have emerged that make perishable artifacts and other "womanly" items more accessible to researchers. "But what is far more decisive," the authors wrote, "is that women have recently joined the archaeological and paleontological workforce in far greater numbers than ever before."

In their investigation of the "grand procession of evolution," including the role of women, the authors draw on evidence from the fossil record, including artifacts and ecofacts; today's primates in general and the great apes in particular; the behaviors of hunters and gatherers who are still with us, such as the San or !Kung of the Kalahari Desert in southern Africa and the Aborigines in Australia; and genetic and molecular biology.

Their paleo-analyses are anything but bone dry. Rather, they're sprinkled liberally with humor, wit, jaunty writing and puns. The chapter on "The Importance of Being Upright," for example, begins: "In which we look back from present conditions to early human evolution and find that the female pelvis may well have saved all us humans from a life of bowling alone as well as letting us become super smart."

Writing about the theoretical possibility of inbreeding between "archaic folk" and modern

humans, they write: "Modern humans will copulate with virtually anything, even barrel cacti, so one can assume that nothing with two legs would have been out of bounds."

One of the stereotypes the authors chip away hardest at is the picture of Upper Paleolithic society and economics "dominated by the mighty hunters setting out to slaughter mammoths and other large animals."

It turns out that "there is no evidence of Upper Paleolithic assemblages of enough hunters – 40 or so – to take down a mammoth, much less the number needed to wipe out a herd. Only the foolhardiest would attempt to kill an animal that stands 14 feet high and has a notoriously bad temper when annoyed."

Because most of the animal remains strewn around places like Dolni Vestonice in the Czech Republic consist of the bones of small mammals like hares and foxes, "The picture of Man the Mighty Hunter is now fading out of the annals of prehistory."

It is more plausible that men and women and even children and the elderly in places like Dolni Vestonice as far back as 27,000 years all contributed to the work of living communally. There is plenty of evidence that immense nets, probably made by women, were tossed over large areas to trap Sunday dinners.

The evidence for master weaving comes from fiber artifacts and from 200 "Venus" figurines and figurine fragments found across Europe – "the most representational three-dimensional images made in the Gravettian period some 27,000 to 22,000 years ago. Nothing is their equal before this period from anywhere in the world, and thousands of years go by before anything comparable appears again," the authors wrote.

Yet many observers, male and female, amateur and professional, have missed the fact that many of these stone babes were partly clad.

In 1998, Adovasio and Soffer began their scrutiny of the Venuses, and found that what others saw as braided hair on the Venus of Willendorf, for

example, actually was an exquisitely carved hat, constructed similarly to many American Indian baskets today.

So precise is the carving that "it is not unreasonable to think that, among the functions involved in this Upper Paleolithic masterpiece, it served as a blueprint or instruction manual showing weavers how to make such hats."

Adovasio and Soffer also discovered that other Venuses wore carved woven hats and also bandeaus, belts and string skirts – items far too flimsy for daily wear.

The clothing suggests that "such apparel was a 'woman thing,' not worn by males, and that it served to immortalize at some great effort the fact that such apparel set women – or at least certain women – apart in a social category of their own."

One can conclude, the authors wrote, that the clothing on the Gravettian Venuses symbolized achievement or prestige. Moreover, the precision with which the woven items were carved "leads almost inevitably to the conclusion that they were created by the weavers themselves, or at least under the sharp-eyed tutelage of the weavers."

"That it was almost surely women who did most of this fine weaving and basketry is one matter to which the ethnographic record appears to be a reliable guide."
